External colors: the part proved and the part still needed

Varying colors without half twists

The whole original source equals its geometric core up to an exponentially small relative error.

Varying colors with half twists

One shared choice of coefficient radii controls a common parameter neighborhood. The axis shows the test for one crossing circle.

Near the opposite endpoint, the complete term has an alias. The original small-color term cancels it; both must be retained.

Schematic slice of normalized integer deficits; the corridor is not drawn to scale. Fix the diagram and its filling slopes first, then let the quantum level N grow.
