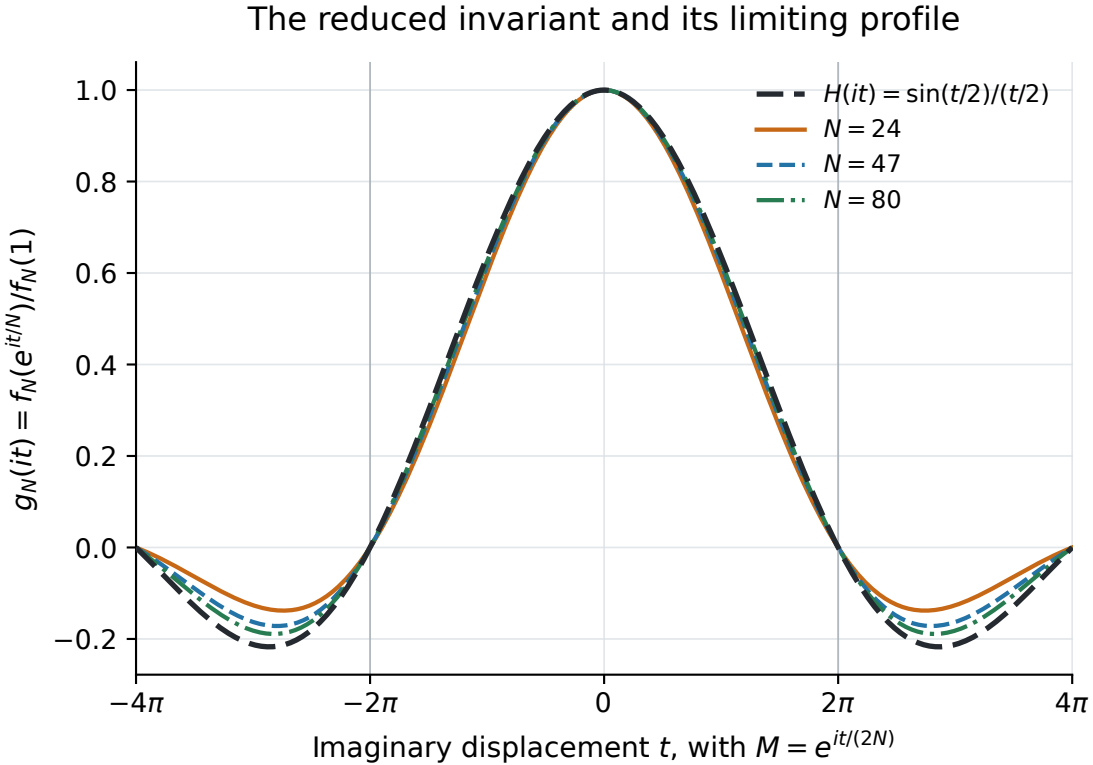
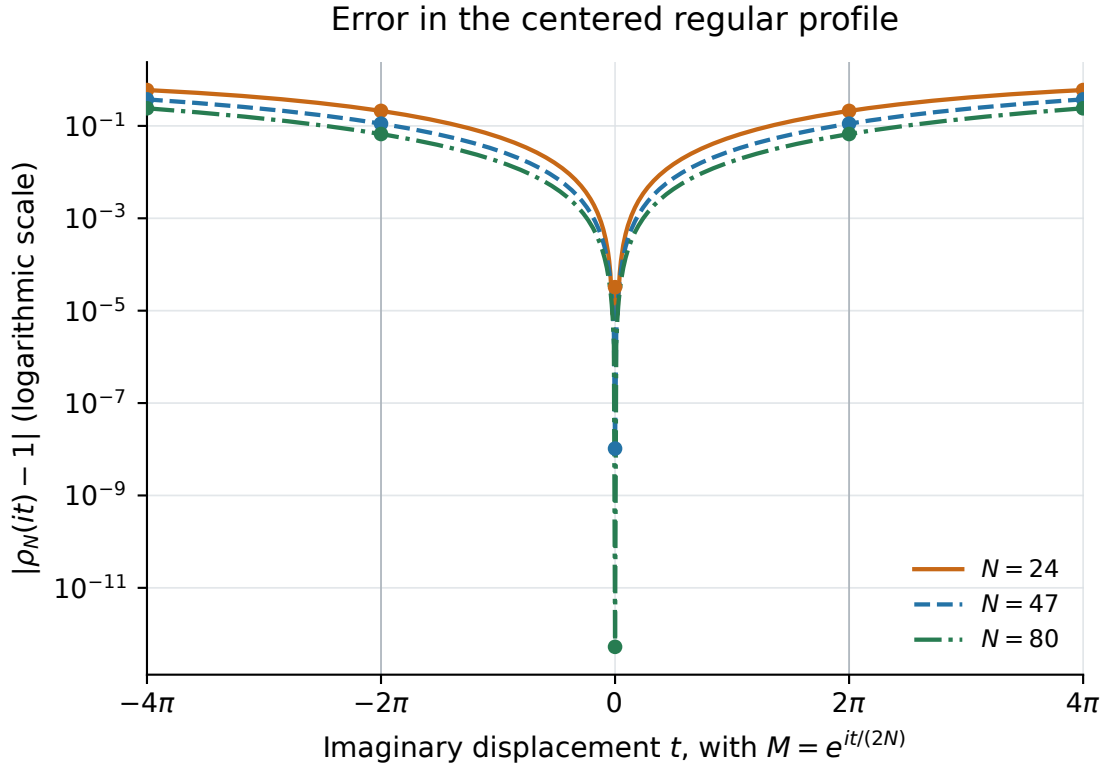
The figure-eight knot: varying the meridian near completeness

Finite sums and their ordinary-color subtraction





$f_N(Y) = S_N(Y)R_N^{\mathrm{reg}}(Y) + P_N^{\mathrm{ord}}(Y),\ \ S_N(Y) = 1 + \cdots + Y^{N-1},\ \ \rho_N(it) = e^{(N-1)it/(2N)}\, NR_N^{\mathrm{reg}}(e^{it/N})/f_N(1).$

Dots use removable values at t = 0, ±2π, ±4π. The plot illustrates convergence; the estimates are proved separately.
