Reflecting a high index and fusing the complete pairing

$d = N - 1$, $r = d - h$, and $\delta\phi_s = \phi_s - \phi_0$. The factors F and G retain the other branches.

$$\sum_{h=0}^{d} \phi_0(e_{d-h}F)\,\phi_0(e_hG) = \phi_0(FG)$$

These graphs record the tangle operations and their complete tensor contractions.
Deleting the turn compares pressures; it does not identify knot complements.
The volume target remains the filled complement of the starting diagram.
