Integer-weighted Conway composition

Children are multiplied in the displayed order.
Unary chains and branching are both allowed.

$$W_v = R^{n_v} \prod_w T(W_w)$$

$$L_v = T(W_v)$$

Terminal vertex: $W_v = R^{n_v}$

Literal root closure:

$$C\left(T(R^{n_0})\, T\left(\prod_w L_w\right)\right)$$

$n_v = \epsilon_v - 2p_v$

One independent integer weight per vertex.

Syntax diagram, not a knot projection.
