
Evaluate the augmented tangle by its finite matrices
Keep both polynomial values and derivatives at repeated roots
Maximize the positive complete-color sum
Build its ideal cells and recover the actual augmented link metric
Bound the signed complementary color terms throughout the construction
Obtain a nonzero holomorphic asymptotic near the complete maximum
Evaluate the entire oscillatory filling sum
Keep contour boundary terms and identify the primitive filling slope
The actual knot complement after all auxiliary fillings
$N^{-1}\log|\langle K\rangle_N| \longrightarrow \mathrm{Vol}(S^3 \setminus K)/(2\pi)$
