# External colors: the part proved and the part still needed

**Untwisted varied ports**

The whole original source equals its geometric core up to an exponentially small relative error.

**One varied signed port**

A sufficient curvature test gives a corridor on this axis. Interacting signed ports remain open.

Near the opposite endpoint, the complete term has an alias. The original small-color term cancels it; both must be retained.

Schematic slice of normalized integer deficits; the corridor is not drawn to scale. Fix the diagram and its filling slopes first, then let the quantum level $N$ grow.
