

A count independent of bridge width

The geometric strip conditions place both sphere flags inside C. A generic line exits through exactly two facets.

At each exit, the three actual prefix diagonals have a nonnegative relation summing to zero. That factor fails strict physical support.

All other factors now have the selected full physical packet. The two exits can be placed at one crossing-circle edge. Its exact four-port block is retained; the sharp contraction and global period estimates remain open.

Schematic planar section in the space of normalized face normals. The dashed circle is the section of the ideal sphere. This is not a picture of the original hyperbolic polyhedron.
