

The full strict physical domain

$0 < \mathrm{Re}\, x_1, \mathrm{Re}\, x_2 < 1$

$\frac{1}{2} < \mathrm{Re}(x_1 + x_2) < \frac{3}{2}$

Pair degree and magnetic coordinate may both be complex. The channel remains an integer.

The finite-level correction matters

The proved finite zero-free domain also requires $|\,\mathrm{Re}(x_1 + x_2) - 1| > 1/(2N)$.

Every fixed compact in the displayed domain is covered for sufficiently large N.

This is the limiting domain projected onto real parts. Imaginary parts are unrestricted; the selected ordinary asymptotic holds on fixed compact subsets with scaled channel bounded away from zero. Dashed boundaries and the degree seam are excluded.
