The folded Gaussian and the primitive cusp rectangle

One polyhedral rectangle

Blue: white-face planes after inversion.
Amber: shaded-face planes.

Two rectangles form the untwisted cusp

Opposite sides are identified.
With μ pointing up
and λ left, $\lambda/\mu \;=\; 2iW/H$.

$$T_b \;=\; \sqrt{b(x+y)+xy}, \quad T_c \;=\; \sqrt{c(x+y)+xy}, \quad H \;=\; (T_b + T_c)/2$$

$$C \;=\; \pi H/W \;>\; 0, \qquad Z \;=\; C - \pi i\epsilon, \qquad \tau_{\mathrm{geom},\epsilon} \;=\; \frac{2\pi i}{Z}$$

The actual complete-circle cosine term has the mesoscopic transform $\exp(-\pi^2 z^2/Z)$ for $h \;=\; z\sqrt{N}$. This is not yet the full mixed-color source or the fixed-color filling packet.
