Product junctions separated by a character

A tree of operations for the auxiliary-colored source

$$p_i = R^{\epsilon_i} L_{j_i}, \qquad h_i = T(p_i).$$

R^{ϵ_i} retains the prescribed half-twist.

L_{j_i} encircles the strands with an auxiliary circle of color j_i.

T is the quarter-turn with the specified endpoint order.

Every edge between product junctions applies T. Each h_i already includes its own quarter-turn. The distinguished leaf p_0 belongs to the original construction.

This is a tree of algebraic operations, not a knot diagram.
