## Ideal hyperbolic pyramid

$$\mathrm{Vol} = \pi g(x)$$

Two shaded triangles retain
the actual crossing-disk pairing.

## Ideal multiplication prism

$$\mathrm{Vol} = \pi m(x, y, z)$$

Three quadrilateral gluing faces;
two triangular projection faces.

Stationarity matches the ordered face shapes: $\kappa_{\mathrm{child}}\kappa_{\mathrm{parent}} = 1$.
All vertices are ideal; the displayed orders determine the face pairings.
