Recovering the two marked faces as one shared strip

Main incidences stay tangent. The matching incidences open at angles $\psi_i = 2\pi\delta_i$, while both circles use the same H.

$$H = r_i(1 + \cos\psi_i), \qquad l_i = \frac{2\cos^2(\pi\delta_i)}{H}$$

$$p_\pm = X_1 \pm r_1 \sin\psi_1 + iH, \qquad \lambda_\pm = -e^{\mp i\psi_1}$$

The fixed points collide at the complete tangency. The line-circle equations retain their selected germs even when the source quadratic has a double root. The diagram illustrates the marked local geometry.
