

A count independent of bridge width

The geometric strip conditions place both sphere flags inside C. A generic line exits through exactly two facets.
At each exit, the three actual prefix diagonals have a nonnegative relation summing to zero. That factor fails strict physical support.

The other factors need not lie in the smaller central domain. Continuation and the global quantum estimate remain open.

Schematic planar section in the space of normalized face normals. The dashed circle is the section of the ideal sphere. This is not a picture of the original hyperbolic polyhedron.
